Access via Access Builder
Septmeber, 2002

General.

Dial in access to the LAN is accomplished via a 3Com Remote access server. This server is not located on the same subnet as the local LAN so some networking which depends on broadcasts will not be available. Pier to pier access to select systems will function as normal. This includes Http, FTP, and telnet. Access to shared resources, LAN login, and network printers will depend on a the particular way in which you access the network, the operating system you are using and what patches have been applied.

1.0   Minimum requirements.

Use a PC that has a modem capable of connecting at least 1600 kilobits per second. pier to pier connections (UNIX) are possible at lower speeds but windows networking connections are not. You will also need software for the application you intend to use such as WEB browser, Telnet or FTP software. We've had success with Exceed 7.3 and X windows protocol.

2.0   Telephone number.

From Miami: **305-361-4465**
From outside the area: 1-888-254-2558

Note: If call-waiting is a feature on your phone, preceed the phone number with *70.

3.0   Account information.

The initial connection must be made using the following account.

Username: user
Password: user

This account provides access for TCP/IP applications only. If your system is properly configured, you will receive a second login request. The second login requires your normal LAN account and password which you would use while in the office. This login provides access to NT shares and printers.

4.0   Host access.
